

Compliance Overview

Aperture Cloud maintains SOC 2 Type II certification, renewed annually. The certification audit covers the ingestion pipeline, the retrieval service, and the generation service, but explicitly excludes customer-managed on-premise deployments, which fall under the customer's own compliance scope.

Encryption Requirements

All customer documents are encrypted at rest using AES-256, and all API traffic is encrypted in transit using TLS 1.2 or higher. Encryption keys are rotated every 90 days, matching the API token rotation policy described in the API reference documentation.

Data Residency

Enterprise customers on the EU plan have their documents and embeddings stored exclusively in the eu-west-1 region. Standard plan customers do not have data residency guarantees and may have documents processed in either us-east-1 or eu-west-1 depending on load balancing at ingestion time.

Audit Logging

Every query and document upload is logged with a timestamp, the requesting API key, and the resulting document or query ID, retained according to the query log retention policy for 180 days.
